Day 2 – Development Environment Setup

Work Done / Learning:
The second day focused on setting up the complete development environment. I installed Visual Studio Code, Node.js, Git, and browser extensions. A local repository was created for version control, and I learned how to use Git commands for committing and pushing code to GitHub. The mentor also demonstrated basic workflow management using branches.

Challenges Faced:
Encountered compatibility issues while setting up Node.js and integrating it with the VS Code terminal, which were later resolved with mentor assistance.

Conclusion / Outcome:
By the end of the day, my environment was fully configured, and I felt comfortable navigating between tools and repositories.
